Adults with CARDIOVASCULAR DISEASE / STROKE Are Among Those Who Need Pneumococcal Vaccination

There are two types of pneumococcal vaccine recommended for US adults: a pneumococcal conjugate vaccine (PCV13) and a pneumococcal polysaccharide vaccine (PPSV23).

Adults 65 and older, and adults age 19 to 64 years with any of the following need to receive both vaccines: immunocompromising conditions or treatments (e.g., HIV/AIDS, leukemia, lymphoma, Hodgkin disease, radiation therapy); a damaged or missing spleen; cochlear implants; or cerebrospinal fluid leaks.

Other adults for whom pneumococcal vaccination is recommended only need PPSV23, but may need more than one dose and will need PCV13 when they, too, reach age 65. Please refer to the Adult Pneumococcal Vaccination Guide or visit cdc.gov/vaccines/ for details on timing of vaccine doses.
